Mol. Gen. Genet. 253, 615-623, 1997
A, Title: MADS box genes expressed in developing inflorescences A, Fittle: MADS box genes expressed in developing inflorescences A, Facesesion: T14737
A, Accession: T14737
A, Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A, Residues: 1-228 <GRE>
A, Cross-references: EMBL:U32110; NID:g1905933; PIDN:AAB50181.1; C; Gene: MADS2
C; Superfamily: transcription factor squa; serum response factor C; Keywords: DNA binding; nucleus; transcription regulation

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Yanofaky, Martin F.
APPLICANT: Pelaz, Soraya
APPLICANT: Ditta, Gary
APPLICANT: The Regente of the University of California
TITLE OF INVENTION: Combinations of Genes for Producing Seed Plants
TITLE OF INVENTION: Exhibiting Modulated Reproductive Development
FILE REFERENCE: 19452A-002400US
CURRENT APPLICATION NUMBER: US/09/853,450
CURRENT APPLICATION SEED IN MEMBER: US/09/853,450
NUMBER OF SEQ ID NOS: 61
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 6
LENGTH: 255
Sequence 2, Application US/09978729A

Patent No. US20020178465A1

GENERAL INFORMATION:
APPLICANT: Yanofeky, Martin F.
APPLICANT: The Regents of the University of California
APPLICANT: The Regents of the University of California
ITLE OF INVENTION: Selective Control of Lignin Biosynthes:
TITLE OF INVENTION: Plants
CURRENT APPLICATION NUMBER: US/09/978,729A

CURRENT FILING DATE: 2002-06-10

PRIOR APPLICATION NUMBER: US 60/090,649
                                                                                                                                                                                                                                                                                                                                                             В

This sequence is the Brassica oleracea AP1 protein. This sequence was used to isolate DNA encoding the Arabidopsis thaliana CAULIFICOMER (CAL) protein of the invention. An expression vector containing the CAL DNA sequence can be used to convert shoot meristems to floral meristems,

                           results in replacement of a few basal flowers by inflorescence shoots that are not subtended by flowers. When API is ecotopically expressed in shoot meristem, the shoot meristem is converted to floral meristem and early flowering can occur. The invention relates to floral meristem identity genes API, LFY and especially CAL (see AAP76885-97 and AAP99437) and their gene products (see AAW23811-18), and their use in converting shoot meristem to floral meristem and in promoting early flowering in transgenic plants, especially angiosperms such as cereal plants, leguminous plants, oilseed plants, trees, fruit-bearing plants or ornamental flowers.
                                                                                                                                                                                                                                                                                           Cauliflower floral meristem identity genes and related used to develop products for converting shoot meristem meristem and promoting early flowering in an anglosperm
                                                                                                                                                                                 This sequence comprises the Brassica oleracea APETALA (AP1) gene product that is involved in the conversion of shoot meristem to floral meristem. B. oleracea AP1 cDNA and genomic DNA sequences are provided (see AAT76886 and AAT76893). Mutation of the AP1 gene
                                                                                                                                                                                                                                                                                                                                                           WPI; 1997-393675/36.

                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a maize MAD3 protein, designated ZmMADS3. The ZmMAD3 protein is essential for flower development and is active in flowers, in particular, in immature flowers and female flowers, but also in the mature embryo sac of maize. The ZmMAD3 protein is also active in nodes and adjacent cell layers. ZmMAD3 polynucleotides and polypeptides are useful influencing flower structure, function and seed or fruit development in transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide encoding ZmMADS3 protein, for use in cloning and expression in plant a nucleic acid sequence encoding protein influencing flower structure, function and/or its seed and/or fruit development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2001-316335/33.

The present sequence is the rice MADS box protein. The MADS box gene be used for regulating plant branching to provide ornamental or agricultural plants. In addition, plants with value-added properties an increased yield can be produced using the MADS box gene.
                                                                                                                                                            Rice MADS box gene for or agricultural plants

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                          The invention relates to a new non-naturally occurring seed plant that comprises a first ectopically expressible nucleic acid molecule encoding a floral meristem identity gene product, provided that the seed plant does not contain a mutation in an endogenous TERMINAL FLOWER (TFL) gene that results in ectopic expression of CAL. The non-naturally occurring seed plant exhibits early reproductive development. The method of promoting early reproductive development can make breeding of long generation seed plants such as trees practical. The method can be used to increase floral meristem identity gene product expression in different crop fields at different times, resulting in a staggered time of harvest for the different fields. The present sequence represents a Zea mays
                                                                                                                                                                                                                                                               New transgenic seed plant exhibiting early reproductive develo comprises a CAULIFLOWER encoding nucleic acid and a non-mutant endogenous TERMINAL FLOWER gene -
                                                                                                                                                                                                                                                                                                        WPI; 2000-181843/16.

This sequence represents the APETALAL (API) amino acid sequence from corn. API is a floral meristem identity product, that promotes conversion of shoot meristem to floral meristem in an angiosperm. Vectors containing the API gene can be used to create transgenic plants. API nucleotide sequences can be used to promote early reproductive development in seed plants which is useful for accelerating selective breeding programmes that require several rounds of crossing to produce plants with disease

Mutation of the AP1 gene results in replacement of basal flowers by inflorescence shoots that are not subtended by flowers. The invention relates to an expression vector comprising a nucleic acid sequence encoding a floral meristem gene product operably linked to a heterologous regulatory element (see AAV02770-75). The floral meristem gene product is selected from AP1, LFY (LEAFY) and CAL (CAULIFLOWER) (see AAW39131-38). The expression vector is used to convert shoot meristem tissue to floral meristem tissue in transgenic plants, especially angiosperms or gymnosperms, thereby promoting early reproductive development in these plants.

The All polypeptide is an ectopically expressible floral meristem identity gene product. The specification also describes CALIFIOWER (CAL) and LEAFY (LFY) gene products. CAL is involved in the conversion of shoot meristem to floral meristem. CAL is highly conserved among different angiosperms. The CAL polynucleotides may be used to shoot meristem to

Ectopic expression of the floral meristem gene product in the shoot meristem tissue of the transgenic plant, allows selection of the time of seed development in the plant which can be useful for manipulating the time of crop harvest in seed-derived crops such as grapes, beans, corn, wheat, rice, hop, etc., or to hasten the breeding of e.g. tree species, for insect or

SXCCCCCCCCCCCCXPXTHHHXX This protein comprises maize floral meristem identity gene product ZAPI, the orthologue of the Arabidopsis APETALA (API) gene product (see AAM43326) that is involved in the conversion of shoot meristem to floral meristem. Mutation of the API gene results in replacement of basal flowers by inflorescence shoots that are not subtended by flowers. The invention relates to a recombinant nucleic acid that Use of floral meristem identity genes to convert shoot meristem t floral meristem - for promoting early reproductive development in the plants and control timing of seed-derived crop harvest(s) in e.g. grapes, beans, corn and wheat This protein comprises maize floral meristem identity Claim 6; Page 110-112; 147pp; English. N-PSDB; AAV06021 ä

Sequence 273 A.

comprises an inducible regulatory element (see AAV06025-28) operably linked to a nucleic acid molecule (see AAV06018-24) encoding a floral meristem identity gene product (see AAV4326-32), especially API, CAULIFLOWER (CAL) or LEAFY (LFY). The nucleic acids are used to

transgenic plants, thereby promoting early reproductive in these plants. This can be useful for manipulating the

ve development the time of time

convert shoot meristem tissue into floral meristem tissue

crop harvest in seed-derived crops and to hasten breeding

                                                                                                            This sequence is the Zea mays AP1 protein (ZAP1). This sequence was used to isolate DNA encoding the Arabidopsis thaliana CAULIFLOWER (CAL) protein of the invention. An expression vector containing the CAL DNA sequence can be used to convert shoot meristems to floral meristems, especially to promote early flowering in angiosperms.

The present sequence represents a floral meristem identity gene product, APETALA1 (API), from Zea mays. The invention relates to a non-naturally occurring seed plant comprising a first ectopically expressible nucleic acid encoding a first floral meristem identity gene product, provided that the first nucleic acid is not ectopically expressed due to a mutation in an endogenous TERMINAL FLOWER gene.
                                                                                                                                      Transgenic plant comprising an ectopically expressed floral meristem gene - for promoting early reproductive development and controlling the time of seed-derived crop harvest(s) in e.g. grapes, beans, corn, wheat, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW43112 standard;

                                                                                                                                                                                                                                                                                                                                                gene product that is involved in the conversion of shoot meristem to floral meristem. The sequence was deduced from an isolated cDNA clone (see AAT99437). ZAP-1 is the maize orthologue of Arabidopsis APETALA (AP1) (see AAW23811). Mutation of an AP1 gene results in replacement of a few basal flowers by inflorescence shoots that are not subtended by flowers. When AP1 is ecotopically expressed in shoot meristem, the shoot meristem is converted to floral meristem and early flowering can occur. The invention relates to floral meristem identity genes AP1, LFY and especially CAL (see AAT76885-97 and AAT99437) and gene products (see AAW23811-18) and their use in converting shoot meristem to floral meristem and in promoting early flowering in transgenic plants, especially angiosperms such as cereal plants. Leguminous plants, of the convertion and the convertion of the conv
